Safety Bump Saves Money

“Repairing damaged hoses and fittings is more expensive and time consuming than most people realize” —

Norm Quagliani, Parts Manager, Tank Truck Service & Sales, Inc.

The typical tanker has five to six transport hoses, each with two expensive fittings. When the hoses are pulled from the transport tubes, often by the ring on the Kamlock ear, they bang against the tarmac or other parts of the truck, damaging the hose fittings and other equipment.

Safety Bump not only provides a handle to enable safe removal of the hoses, but its protective design ensures that the fittings do not hit the ground, eliminating the possibility of damage. Broken ears, egg shaped fittings and nicked or gouged sealing surfaces require expensive repairs, or worse, create leaks at a load / unload customer site.

Safety Bump

- Extends the life of \$\$\$\$ worth of hoses per truck
- Gives the driver complete control of his hoses
- Anti-static glass-filled or FDA-certified composite
- Patent pending design
